GO (General Oscillogram)

Module for the recording and precise recording of various signal distortions and transient events. This module records the "oscillograms" of voltages and powers with extended details (up to 288 samples per period) and trigger options in high resolution in the memory. Stored data can be processed in ENVIS or exported to .xls or .csv files for processing in any third-party

application. ENVIS not only allows the calculation of the rms value of power and voltage, but also of harmonics, THDs and other values. The averaging of the calculated data can be configured from 1 period.

Designation	Description	Availability	Order no.
GO	Oscilloscope function	See technical specifications	53.21.1340
